Examples of SOAP Notes for Occupational Therapy

I. The Indispensable SOAP Note **A. Defining the SOAP Note Acronym: A Primer** The ubiquitous SOAP note—Subjective, Objective, Assessment, Plan—serves as the linchpin of comprehensive healthcare documentation. Its structured format allows for efficient and lucid communication among healthcare professionals. It's an essential tool for documenting the intricate trajectory of a patient's progress. **B. The Significance of Accurate SOAP Note**

Documentation Accurate SOAP note documentation is paramount. It's not merely a bureaucratic requirement but a cornerstone of effective patient care. Careful record-keeping ensures continuity of care and facilitates informed decision-making. A well-documented SOAP note allows seamless transitions between professionals, providing a chronologic portrayal of the treatment journey. C. Legal

Ramifications of Inadequate Documentation Negligent or incomplete SOAP notes can carry severe legal consequences. In the event of medical-legal disputes, meticulously maintained documentation serves as the most potent defense – a bulwark against malpractice claims. This irrefutable record provides a clear and concise account of provided care. II. Subjective Data:

The Client's Perspective **A. Gathering Subjective**

Information: Interview Techniques Eliciting subjective data requires adept interviewing skills. Active listening, empathetic engagement, and open-ended queries are indispensable. The clinician must cultivate rapport to encourage the patient to articulate their experiences freely. This humanistic approach yields valuable insights into their functional deficits and the challenges they encounter. *B. Examples of Subjective Statements in OT SOAP Notes: Pain, Functional Limitations, Client Goals* "Patient reports

persistent pain in her right shoulder, exacerbated by overhead activities." "Client states difficulty with dressing, particularly buttoning shirts." "Patient verbalizes a goal of regaining independence with meal preparation." These succinct statements capture the essence of the client's self-reported limitations. They form the narrative backdrop against which objective observations are interpreted. **C. Verbatim**

Quotations & Their Importance Precise verbatim quotations underscore the objectivity of the record. Capturing the patient's own words, within quotation marks, enhances the authenticity and trustworthiness of the documentation. Their direct experiences are not subject to interpretation or distortion. *III. Objective Data: Measurable Observations*

A. Quantitative vs.

Qualitative Data: A Critical Distinction Objective data

comprises both quantitative and qualitative observations. Quantitative data—such as range of motion measurements, grip strength scores, and time taken to complete a task—provides numerical benchmarks. Qualitative data encompasses descriptive observations of the patient's performance, noting effort, posture and coordination. **B. Employing**

Standardized Assessments: Examples and

Interpretation Standardized assessments, such as the Functional Independence Measure (FIM) or the

Canadian Occupational Performance Measure (COPM), provide structured methods for quantifying functional limitations. The resulting scores are not viewed in isolation, but rather are contextualized by the subjective experience of the patient. C. Observational Data Recording: Detailed Description of Client Performance Objective documentation includes detailed descriptions of the client's performance during activities. The clinician notes posture, movement quality, compensatory strategies employed, and any observable limitations. Specific examples are vital: "Patient exhibits limited range of motion in the left elbow, approximately 90 degrees of flexion". D. Illustrative Objective Data Examples: ROM, Grip Strength, ADL Performance "ROM (Range of Motion) in right shoulder: flexion 120 degrees, abduction 90 degrees." "Grip strength: 25 lbs dominant hand, 20 lbs non-dominant hand." "ADL (Activities of Daily Living): independent with grooming, requires moderate assistance with dressing." These concrete details paint a vivid picture of the client's functional status, devoid of ambiguity. **IV.**

Assessment: Synthesizing the Data A.

Interpreting the Combined Subjective and

Objective Data This section represents the synthesis of the subjective and objective information. It's the

crux of clinical reasoning, where data is analyzed to formulate a comprehensive assessment of the client's occupational performance. The clinician identifies patterns, connections, and areas that need focused intervention. B. Identifying Occupational Performance

Deficits: Functional Limitations The assessment pinpoints specific occupational performance deficits, identifying areas where the client experiences limitations in their ability to participate in daily activities. This highlights the discrepancies between their desired and actual performance, identifying the root causes of their functional shortcomings. **C.**

Utilizing Clinical Reasoning: Diagnostic Impression and Prognosis This section utilizes clinical reasoning to form a diagnostic impression, integrating the patient's subjective experience, observable performance, and test results. It also offers a provisional prognostic statement, illustrating potential outcomes with timely and relevant intervention. Such a prognosis is frequently expressed in terms of probabilities. D. Examples of Well-Written

Assessment Sections: Connecting the Dots "Based on the client's subjective reports indicating pain during overhead reaching, and objective observations displaying significant limitations in shoulder ROM which impact activities of daily living such as dressing,

a diagnosis of rotator cuff impingement is suspected."

This coherent narrative directly links the observations to a clinical conclusion. **V. Plan: The Road Map to**

Intervention A. Developing a Goal-Oriented Plan of Care: SMART Goals

The plan of care outlines specific, measurable, achievable, relevant, and time-bound (SMART) goals. These are collaboratively developed with the patient, ensuring their alignment with the client's individual circumstances and functional aspirations. The plan serves as the compass for guiding the therapeutic process. B. Selecting

Appropriate Interventions: Evidence-Based Practices

The plan details the specific interventions to be implemented, drawing upon evidence-based practices whenever possible. These interventions are tailored to address the client's identified limitations and achieve their stated therapeutic goals. The judicious application of evidence-based intervention methodologies is key. **C. Frequency and Duration of**

Treatment Sessions: Customized Approach

The frequency and duration of treatment sessions are determined based on the individual needs and responses of the client. The clinician ensures a customized therapeutic approach, adjusting the treatment regimen as needed to maximize outcomes and efficiency. **D. Examples of Comprehensive**

Treatment Plans: Specific Interventions and

Rationale "Implement a home exercise program focused on strengthening shoulder musculature, including active range of motion exercises and isometric contractions. Three times per week for the next 6 weeks. Rationale: To reduce pain and improve ROM." This specific example lays out the plan with clear justifications. **E. Revisiting and Modifying the**

Plan Based on Client Progress The plan isn't static. It's a dynamic document that is revisited and modified throughout the course of treatment, adapting to the client's evolving needs and progress. Regular reevaluation is the key to adjusting the intervention strategy as needed. VI. Remember, precision and clarity are vital to effective communication within the healthcare team. Accurate record-keeping protects both the client and the practitioner.

Occupational therapists (OTs) play a vital role in helping individuals regain or develop the skills needed to perform everyday activities. Whether it's mastering dressing after an injury, adapting to a new diagnosis, or improving fine motor skills for schoolwork, OTs are there. And at the heart of their practice lies meticulous documentation – the trusty SOAP note.

You might be wondering, "What exactly is a SOAP note, and why is it so important in occupational therapy?" Let's dive in! SOAP notes are a standardized method of recording patient progress, outlining interventions, and communicating effectively within the healthcare team. They are crucial for justifying medical necessity, tracking outcomes, and ensuring continuity of care. Think of them as the OT's narrative, telling the story of a client's journey towards independence and improved quality of life.

For new OTs or even seasoned professionals looking for a refresher, understanding how to craft effective SOAP notes can sometimes feel like a puzzle. This

article aims to demystify the process by providing a variety of [examples of SOAP notes for occupational therapy](#), covering different practice settings and client needs. We'll explore what goes into each section – Subjective, Objective, Assessment, and Plan – and why each piece is critical. Let's get started!

Understanding the SOAP Note Structure

Before we jump into the examples, let's quickly recap the four components of a SOAP note. This structure ensures a clear, concise, and organized record of the client's session.

Subjective (S)

This section captures the client's perspective – what they say, how they feel, and what their concerns are. It's their voice in the documentation. This includes:

1. Client's reported pain level and location.
2. Their perception of their functional abilities.
3. Any complaints or difficulties they experienced since the last session.
4. Their goals and motivations.
5. Information from family members or caregivers if

the client is unable to communicate effectively.

Think of this as the "story" the client tells you.

Keywords here might include "reports," "states," "denies," "complains," "feels," "expresses."

Objective (O)

This is where you, the OT, document your direct observations and measurable findings. It's the factual, unbiased data collected during the session. This includes:

1. Specific activities performed during the session.
2. Objective measurements (e.g., range of motion, grip strength, time to complete a task).
3. Observations of the client's performance, including quality of movement, compensatory strategies, and safety.
4. Results of standardized or non-standardized assessments administered.
5. Therapist's interventions and the client's response to them.

This section is all about what you can see, measure, and test. Keywords might include "observed," "measured," "demonstrated," "performed," "completed," "participated."

Assessment (A)

This is the analytical part of the note. Here, you interpret the subjective and objective information to draw conclusions about the client's progress, deficits, and potential. It's your professional judgment. This includes:

1. Analysis of the client's performance in relation to their goals.
2. Identification of barriers and facilitators to participation.
3. Clinical reasoning explaining the client's current status.
4. Your professional opinion on the effectiveness of interventions.
5. Prognosis and potential for improvement.

This is where you connect the dots. Keywords might include "indicates," "suggests," "suggesting," "demonstrates," "consistent with," "impacting," "contributing to."

Plan (P)

This section outlines the proposed course of action for future interventions. It's a forward-looking statement detailing what will happen next. This includes:

1. Frequency and duration of future therapy sessions.
2. Specific interventions to be implemented in the next session(s).
3. Modifications to current interventions based on progress or challenges.
4. Referrals to other professionals or resources.
5. Home exercise program (HEP) or strategies for the client to practice.
6. Goals for the next session or short-term goals.

This is the roadmap for continued care. Keywords might include "continue," "increase," "decrease," "modify," "introduce," "educate," "recommend," "follow up."

Examples of SOAP Notes for Occupational Therapy

Now, let's put the structure into practice with a variety of [occupational therapy SOAP note examples](#). These examples showcase how the SOAP format can be adapted for different client populations and practice settings.

Pediatric Occupational Therapy SOAP

Note Example (Child with Autism Spectrum Disorder)

This example focuses on a child working on social skills and fine motor development.

Subjective (S)

Mom reports that Leo (age 6) had a "pretty good week." He initiated a brief interaction with a peer at the park, asking to play with a toy truck, which she described as a "huge step." She also noted that Leo seemed less overwhelmed by loud noises at the grocery store this week and used his weighted lap pad when he started to feel anxious. Leo grunted when asked about school and pointed to a drawing of a block tower, indicating he enjoyed building during playtime.

Objective (O)

OT session focused on social interaction skills during a structured board game and fine motor task of assembling a Lego castle. Leo participated in the "Turn-Taking Game" for 10 minutes before becoming disengaged. He was prompted 3 times to wait his turn and offered a visual cue (a red and green card). OT observed Leo using a bilateral grasp to manipulate

Lego bricks, requiring moderate effort. He successfully placed 15 bricks to build a castle tower, with assistance from OT modeling proper hand placement on 5 occasions. OT provided sensory breaks using a rocking chair and deep pressure input, which Leo tolerated for 3 minutes each. Grip strength assessment (dynamometer) measured at 15 lbs in his dominant right hand, compared to 18 lbs at previous assessment.

Assessment (A)

Leo demonstrates emerging social reciprocity, as evidenced by his reported initiation of peer interaction and his participation in the turn-taking game, although requiring external prompts. His sensory regulation strategies (weighted lap pad use) appear to be effective in managing environmental stimuli. Fine motor skills for bilateral manipulation of small objects are developing, with the ability to place Lego bricks independently but still benefiting from OT modeling for efficient grasp. The slight decrease in grip strength warrants monitoring, though it may be influenced by fatigue during the assessment. Continued focus on social engagement and fine motor precision is indicated to promote functional participation in play and classroom activities.

Plan (P)

Continue OT sessions 1x/week for 45 minutes.

1. Introduce social script cards for initiating play with peers during structured group activities.
2. Increase demand for independent turn-taking in games, fading prompts gradually.
3. Continue fine motor activities involving small manipulatives (e.g., beads, puzzles) with increased complexity.
4. Incorporate pre-writing strokes practice, focusing on pincer grasp development.
5. Educate parent on strategies for reinforcing social initiations at home.
6. Reassess grip strength in 2 weeks.

Adult Physical Rehabilitation SOAP

Note Example (Stroke Recovery)

This example focuses on an individual recovering from a stroke, aiming to improve activities of daily living (ADLs) and instrumental activities of daily living (IADLs).

Subjective (S)

Mr. Jones reports feeling "stronger" this week but is

still frustrated by his left arm's weakness and lack of coordination. He states he can now put on his shirt with "less fumbling," but buttoning is "still a nightmare." He expresses a desire to be able to make his own breakfast independently. He denies any new pain but reports some mild fatigue after his therapy sessions.

Objective (O)

OT session focused on upper extremity (UE) dressing and meal preparation tasks. Client demonstrated improved ability to don a button-down shirt with his right arm, requiring moderate verbal cues for stabilizing the shirt with his left hand. He was able to independently hook the first two buttons but struggled with subsequent buttons due to decreased pinch strength and dexterity in his left digits. For meal preparation, Mr. Jones participated in making a sandwich. He was able to spread peanut butter with a weighted utensil using his right hand, with minimal assist to stabilize the bread with his left hand. He completed this task in 5 minutes. UE range of motion (ROM) of the left shoulder flexion was measured at 110 degrees (up from 90 last week). Tone in his left forearm was observed to be 2+ on the Modified Ashworth Scale.

Assessment (A)

Mr. Jones is demonstrating functional progress in UE dressing and basic meal preparation, particularly in his dominant right arm. His reported increase in strength is consistent with observed improvements in left shoulder flexion ROM. The persistent challenges with buttoning and stabilizing bread highlight deficits in left-sided fine motor control, pinch strength, and coordination, likely related to his stroke. The ability to independently spread peanut butter with some left-hand stabilization indicates improved motor planning and bilateral integration. His motivation to achieve independence in meal preparation is a strong driver for continued therapy.

Plan (P)

Continue OT 3x/week for 60 minutes.

1. Introduce adaptive equipment for dressing, such as button hooks and zipper pulls.
2. Continue practicing buttoning and unbuttoning on various materials and sizes.
3. Progress meal preparation tasks to include cutting soft foods with adaptive utensils.
4. Initiate basic kitchen safety training, including safe use of appliances.

5. Incorporate specific exercises to improve left finger isolation and pincer grasp.
6. Encourage client to practice observed strategies for stabilizing objects with his left hand during daily tasks.
7. Monitor for fatigue and adjust activity pacing as needed.

Geriatric Occupational Therapy SOAP Note Example (Fall Prevention/Home Safety)

This example focuses on an older adult experiencing concerns about falls and independence at home.

Subjective (S)

Mrs. Davis reports feeling "a bit unsteady" when reaching for items on high shelves. She expresses anxiety about falling, especially in the bathroom. She states she has been more careful about where she walks but still "worries" about tripping on her rug. She reported successfully using her grab bar in the shower yesterday and felt "much safer." She denied any falls or near falls in the past week.

Objective (O)

OT conducted a home safety evaluation and observed Mrs. Davis ambulating in her home. She demonstrated steady gait on level surfaces but exhibited increased trunk sway and reduced step length when navigating a small rug in the living room. She required verbal cues to maintain a wider base of support when reaching overhead for a cereal box from a kitchen cabinet. In the bathroom, she independently used the installed grab bar to lower and rise from the toilet, demonstrating appropriate weight bearing. She was able to transfer safely into and out of the shower stall. Functional Reach Test measured at 18 inches forward.

Assessment (A)

Mrs. Davis demonstrates good functional mobility on clear pathways and appropriate use of existing assistive devices (grab bar). Her reported unsteadiness when reaching overhead and navigating uneven surfaces (rug) indicates a potential fall risk due to impaired balance and proprioception in dynamic situations. The anxiety surrounding falls is impacting her confidence in performing everyday tasks. Her successful use of the grab bar suggests she is receptive to adaptive strategies. Continued focus on

balance training and home modifications is essential for fall prevention and maintaining independence.

Plan (P)

Continue OT 1x/week for 30 minutes, focusing on home safety and balance.

1. Educate Mrs. Davis on safe strategies for reaching and retrieving items from high shelves.
2. Recommend removal of the living room rug or securing it with non-slip backing.
3. Introduce a seated exercise program focusing on lower extremity strengthening and dynamic balance exercises.
4. Provide education on proper footwear for fall prevention.
5. Review emergency preparedness strategies and how to call for help.
6. Schedule a follow-up home safety assessment in 4 weeks.
7. Encourage Mrs. Davis to continue verbalizing her concerns and reporting any changes in her balance or mobility.

Mental Health Occupational Therapy

SOAP Note Example (Anxiety and Depression)

This example focuses on an individual with anxiety and depression, aiming to improve engagement in meaningful activities and coping skills.

Subjective (S)

Client reported feeling "overwhelmed" and experiencing increased tearfulness this past week. She stated, "It's hard to get out of bed some mornings." She reported difficulty concentrating on her assigned task of journaling, stating, "My mind just races." She expressed a desire to reconnect with her hobby of painting but felt "uninspired" and lacked the energy to start. She denied suicidal ideation.

Objective (O)

OT session focused on developing a structured daily routine and exploring coping strategies. Client participated in a guided mindfulness exercise for 5 minutes, reporting a mild decrease in racing thoughts. OT introduced a simplified visual schedule for the upcoming week, which client reviewed with minimal engagement. Client was offered art supplies to begin a

painting, but she declined, stating, "I just can't." OT provided education on basic relaxation techniques (deep breathing) and demonstrated how to incorporate them into short breaks throughout the day. Client acknowledged the techniques but did not practice them independently during the session.

Assessment (A)

Client continues to experience significant symptoms of depression and anxiety, which are impacting her ability to engage in self-care and meaningful activities, as evidenced by reported low energy, tearfulness, and difficulty initiating tasks. Her cognitive symptoms of racing thoughts and poor concentration are barriers to engagement in therapeutic activities such as journaling. While she expressed a desire to return to painting, her current affective state is a significant impediment. She is receptive to learning coping strategies but requires consistent support and practice to integrate them into her daily life. Establishing a structured routine is a crucial step in building momentum towards increased engagement and improved mood.

Plan (P)

Continue OT 2x/week for 60 minutes.

1. Collaboratively develop a more detailed and manageable daily routine, focusing on small, achievable steps.
2. Reintroduce journaling with prompts focusing on gratitude and positive experiences.
3. Gradually reintroduce creative arts activities, starting with shorter durations and less demanding tasks (e.g., sketching, coloring).
4. Continue to practice and reinforce mindfulness and relaxation techniques, scheduling specific times for practice.
5. Explore and identify client's valued activities and barriers to participation.
6. Provide psychoeducation on the impact of depression and anxiety on motivation and energy levels.
7. Monitor for any changes in mood or suicidal ideation and report as per protocol.

Key Takeaways for Effective SOAP Notes

As you can see from these [occupational therapy SOAP note examples](#), consistency and clarity are key. Here are some final tips to help you craft stellar SOAP notes:

1. **Be Specific and Measurable:** Quantify where possible. Instead of "improved," say "increased ROM by 10 degrees."
2. **Focus on Function:** Always tie your observations and interventions back to the client's functional goals. How does this impact their ability to participate in life?
3. **Use Professional Language:** Maintain a professional tone and use appropriate terminology. Avoid slang or overly casual language.
4. **Be Objective in the 'O' Section:** Stick to facts and avoid interpretations. Save your clinical reasoning for the 'A' section.
5. **Justify Your Plan:** Ensure your plan logically follows from your assessment. Every intervention should have a purpose.
6. **Be Concise but Comprehensive:** Provide enough detail to be informative but avoid unnecessary wordiness.
7. **Proofread:** Errors can lead to miscommunication. Always review your notes before submitting them.
8. **Know Your Facility's Guidelines:** Each setting may have specific documentation requirements or preferred formats.

Mastering SOAP notes is an ongoing process, and the more you practice, the more natural it will become.

These [occupational therapy SOAP note examples](#) are designed to be a starting point. Remember to adapt them to your specific clients and clinical reasoning. By diligently documenting your sessions, you contribute to effective communication, evidence-based practice, and ultimately, better outcomes for your clients.

Soap Notes in Occupational Therapy: Real-World Examples and Their Impact Occupational therapy (OT) relies on structured documentation to track client progress, communicate with interdisciplinary teams, and ensure continuity of care. At the heart of this practice are SOAP notes—Subjective, Objective, Assessment, and Plan documents—that provide a clear, consistent framework for recording clinical insights. These notes go beyond mere paperwork; they reflect a therapist’s clinical reasoning and serve as vital tools in guiding treatment decisions. When applied thoughtfully, SOAP notes transform raw observations into actionable insights that support effective rehabilitation.

Understanding the Components of a SOAP Note in OT The SOAP

model offers a comprehensive structure tailored to the unique demands of occupational therapy. The Subjective section captures the client's personal experience—symptoms they report, emotional state, goals they express, and challenges they face in daily life. For example, a note might begin with, “Client reports increased wrist pain during cooking tasks, particularly when using kitchen utensils, limiting independence.” This section grounds the therapy process in the client's lived reality, ensuring treatments

remain person-centered. In the Objective section, the therapist records measurable, observable data—physical performance, functional abilities, and behavioral responses. This could include specific observations such as “Client demonstrates reduced grip strength of 25 pounds compared to baseline 35 pounds,” or “Exhibits avoidance of weight-bearing on the right leg during gait training,” providing concrete evidence of progress or areas needing attention. The Assessment phase synthesizes subjective and objective findings

to form a clinical judgment. Here, therapists analyze patterns, identify underlying impairments, and consider contributing factors. For instance, “Impaired fine motor coordination and reduced endurance contribute to difficulty with buttoning clothes and sustaining self-care activities.” This step transforms data into meaningful diagnosis or functional limitations central to guiding intervention. Finally, the Plan outlines targeted, measurable short- and long-term goals, along with specific therapeutic strategies. It might

state, “Implement progressive grip strengthening exercises with adaptive tools, aiming for 30 pounds grip strength within six weeks to improve dressing independence. Monitor biomechanics and client feedback throughout.” This forward-looking approach ensures therapy remains purposeful and accountable.

Real-World Applications Across Clinical Settings Soap notes find broad application across diverse occupational therapy contexts. In pediatric settings, they document developmental milestones and

sensory processing challenges. A therapist might note in the Subjective column, “Child expresses frustration during fine motor tasks, avoiding puzzles and coloring,” while Objective findings capture delayed scissor skills and poor pencil grip. The Assessment could identify sensory integration difficulties impacting participation, leading to a Plan involving play-based sensory activities and adaptive tools to enhance engagement and motor precision. In mental health and neuropsychological rehabilitation, SOAP notes help

track cognitive-emotional barriers. For example, a client with post-stroke depression may report low motivation and difficulty initiating self-care. The Objective section might record reduced engagement in activity schedules, while the Assessment links these behaviors to depressive symptoms affecting functional recovery. The Plan could integrate goal-setting with behavioral activation techniques and mindfulness strategies, supported by regular SOAP documentation to monitor emotional and functional gains.

Geriatric occupational therapy often uses SOAP notes to address aging-related challenges like balance decline or arthritis. A note might reveal, “Client reports frequent falls at home, especially stepping off curbs; objective assessment shows decreased lower extremity strength and delayed reaction times.” The Assessment identifies musculoskeletal limitations and environmental risks. The Plan focuses on strength training, gait retraining, and home safety recommendations, with SOAP notes ensuring continuity as

needs evolve.

Key Benefits of Standardized SOAP Documentation

The structured nature of SOAP notes brings numerous advantages to occupational therapy practice.

First, they enhance clinical clarity by organizing complex information into digestible sections, enabling therapists to quickly grasp client status and treatment needs. This efficiency supports timely decision-making and reduces documentation errors. Second, SOAP notes strengthen communication across multidisciplinary teams—whether

sharing updates with physicians, caregivers, or educators—fostering collaborative care. Third, they serve as legal and professional safeguards by providing a transparent, auditable record of clinical reasoning and interventions. Equally important is their role in client advocacy. By documenting subjective experiences alongside objective progress, therapists validate clients' voices and ensure their goals remain central to care planning. This person-centered approach not only improves

satisfaction but also enhances treatment adherence and outcomes.

Looking Ahead: The Evolving Role of SOAP Notes in OT As healthcare continues to embrace digital innovation, SOAP documentation is adapting to new technologies. Electronic health records (EHRs) now support real-time SOAP entry, cloud-based sharing, and automated progress tracking, streamlining workflows and improving data accessibility. Artificial intelligence and machine learning are beginning to assist in generating structured templates,

flagging trends, and suggesting evidence-based interventions—enhancing clinical efficiency without diminishing the human touch. Yet, the core principles of thorough, empathetic documentation remain unchanged. The future of SOAP notes in occupational therapy lies in balancing technological advancement with the art of therapeutic communication. As OT expands into telehealth and community-based care, SOAP notes will continue to serve as essential tools for maintaining quality,

accountability, and client-centered focus across diverse settings. Through consistent, thoughtful application, SOAP notes empower occupational therapists to deliver precise, compassionate care—one documented session at a time.

Mastering Occupational Therapy Documentation: A Deep Dive into Soap Note Examples

In the dynamic and patient-centered world of occupational therapy (OT), clear, concise, and comprehensive documentation is paramount. It not only serves as a

legal record of patient care but also acts as a vital communication tool among healthcare professionals, a basis for billing and reimbursement, and a roadmap for ongoing treatment. Among the most widely used documentation formats in OT is the SOAP note. Understanding and effectively utilizing SOAP notes is a foundational skill for any occupational therapist. This article will delve into the intricacies of SOAP notes, providing detailed examples of soap notes for occupational therapy across various practice

settings, along with analysis to illuminate best practices.

The SOAP acronym stands for Subjective, Objective, Assessment, and Plan. Each section plays a distinct and crucial role in painting a complete picture of the patient's progress, challenges, and therapeutic trajectory. Mastering this format ensures that interventions are well-justified, progress is clearly tracked, and the value of occupational therapy is effectively communicated.

**The Pillars of a SOAP Note:
Deconstructing the Acronym
Before we explore specific**

examples, it's essential to grasp the purpose and content expected within each component of a SOAP note:

Subjective (S): The Patient's Perspective

This section captures the patient's self-report. It includes their subjective experience of their condition, symptoms, pain levels, functional limitations, and their perception of progress or regression. Direct quotes from the patient are encouraged here to preserve their voice. Think of it as asking, "What does the patient tell you?"

- 1. Patient's reported pain level (e.g., "I'm feeling a 6/10 pain in my shoulder today, worse with reaching overhead").**
- 2. Reported difficulties with daily activities (e.g., "I had trouble buttoning my shirt this morning").**
- 3. Patient's goals and motivations (e.g., "I really want to be able to carry my groceries again").**
- 4. Any changes in symptoms since the last session.**
- 5. Patient's understanding of their condition and treatment.**

Objective (O): The Therapist's

Observations and Measurements

This is where the occupational therapist records their objective findings. It includes observable data, measurable outcomes, and the results of standardized assessments or functional tests. This section should be factual, unbiased, and detailed. Think of it as asking, "What do you see and measure?"

- 1. Range of motion (ROM) measurements.**
- 2. Muscle strength grades (e.g., MMT 4/5).**
- 3. Results of functional assessments (e.g., Timed Up**

and Go test, Box and Blocks test).

- 4. Observation of the patient's performance during therapeutic activities (e.g., "Observed difficulty with grip strength during fine motor tasks").**
- 5. Vital signs, if relevant.**
- 6. Specific interventions performed during the session (e.g., "Performed therapeutic exercises for shoulder strengthening and provided adaptive equipment recommendations").**

Assessment (A): The Therapist's

Professional Judgment

This is the heart of the SOAP note, where the therapist synthesizes the subjective and objective information to provide their professional opinion. It includes an analysis of the patient's progress, the effectiveness of interventions, and the identified deficits. This section justifies the need for continued occupational therapy services. Think of it as asking, "What does it all mean?"

- 1. Interpretation of the subjective and objective findings.**
- 2. Analysis of the patient's**

progress towards goals.

- 3. Identification of barriers to progress or ongoing deficits.**
- 4. Justification for continued OT services (e.g., "Patient demonstrates continued need for OT to improve independence in IADLs").**
- 5. Prognosis and expected outcomes.**
- 6. Summary of the patient's response to treatment.**

Plan (P): The Future Course of Treatment

This section outlines the planned interventions and future course of treatment. It should be

Illuminating Examples of Soap Notes for Occupational Therapy

To truly understand the application of the SOAP note format, let's explore detailed examples from different OT practice areas. These examples are designed to be comprehensive and illustrative.

Example 1: Post-Stroke Patient - Upper Extremity Rehabilitation

Client Name: John Doe

Date of Service: 2023-10-27

Diagnosis: Ischemic Stroke with Left Hemiparesis and Sensory Deficits

OT Session #: 5

Subjective (S):

"I'm feeling a bit tired today, but my arm is starting to feel a little stronger. I still can't really feel my fingers well, and it's hard to pick up small things like buttons. My wife said I managed to hold my toothbrush for longer this morning. I'm still worried about falling, especially on my left side."

Objective (O):

Observation: Patient alert and oriented x3. Appears fatigued but motivated. Demonstrates mild guarding of the left upper

extremity.

Range of Motion (ROM): Left Shoulder AROM: Flexion 80°, Abduction 70° (with compensatory trunk lean); Elbow Flexion 100°, Supination 50°. Passive ROM within functional limits.

Muscle Strength (MMT): Left Deltoid 2/5, Biceps 2/5, Wrist Extensors 2/5. Right Upper Extremity 5/5.

Sensory: Light touch and proprioception diminished in left hand and forearm.

Functional Observation: Patient attempted to don a shirt.

Required significant assistance with manipulating buttons and positioning the left arm.

Demonstrated poor proximal stability of the left shoulder during reaching tasks.

Interventions: Therapeutic activities focusing on bilateral upper extremity integration (e.g., stacking blocks with affected and unaffected arm), neuromuscular electrical stimulation (NMES) to left biceps and deltoid, proprioceptive input activities (e.g., weight-bearing through affected arm).

Assessment (A):

Mr. Doe continues to demonstrate significant deficits in left upper extremity strength, ROM, and sensation following his ischemic stroke. His reported fatigue is consistent with his observed effort during therapeutic activities. While there is a slight subjective improvement in perceived arm strength and a report of increased toothbrush holding time, objective measures show minimal change in active ROM and muscle strength since the last session. His poor proximal stability and diminished sensation are primary barriers to

functional use of his left arm for tasks such as dressing and object manipulation. The observed compensatory trunk lean during reaching indicates a need to focus on improving shoulder girdle stabilization. Continued OT intervention is medically necessary to promote functional recovery, reduce the risk of contractures, and improve safety with ADLs and IADLs. Patient demonstrates a good understanding of exercises but requires consistent therapist guidance to maximize engagement.

Plan (P):

Continue OT 3x/week for 4 weeks.

- 1. Progress bilateral upper extremity activities, increasing complexity and decreasing verbal cues.**
- 2. Continue NMES to left biceps and deltoid, adjusting parameters as needed based on muscle response.**
- 3. Initiate weight-bearing exercises through the left arm on a stable surface (e.g., table top) and progress to inclined surfaces to improve shoulder girdle stability.**
- 4. Incorporate functional reaching**

tasks with the left arm to a variety of heights and distances, focusing on quality of movement and minimal compensation.

- 5. Provide tactile and proprioceptive stimulation activities for the left hand to improve sensory awareness.**
- 6. Educate patient and wife on safe dressing strategies and provide a simplified HEP for home practice focusing on basic ROM and weight-bearing.**
- 7. Re-evaluate functional mobility and balance with future sessions to address fall risk.**

Example 2: Pediatric Patient - Sensory Processing Disorder

Client Name: Emily Smith

Date of Service: 2023-10-27

Diagnosis: Sensory Processing Disorder, Primarily Hyposensitive to Tactile Input and Gravitational Insecurity

OT Session #: 8

Subjective (S):

"Emily was a little hesitant to come in today. She said the swings made her tummy feel 'wiggly' and she didn't want to get 'stuck up high.' When we got here, she ran away from the therapist and hid behind her

mom. She did tell me she liked the fluffy beanbag chair."

Objective (O):

Observation: Emily presented with significant avoidance behaviors at the start of the session, displaying a fight-or-flight response to perceived sensory challenges. She sought deep pressure input by leaning heavily on the therapist and walls.

Sensory Diet Activities: Engaged in linear vestibular input via a swinging motion in a hammock (initially resisted, then tolerated for 2 minutes with deep pressure

through therapist's hands). Participated in obstacle course including crawling through tunnels (tolerated well) and climbing over cushions (required therapist support and redirection). Engaged in deep pressure activities such as rolling in a large therapy ball and being tucked into a "burrito" with blankets.

Motor Skills: Gross motor coordination appears developing, though significant gravitational insecurity impacts her willingness to explore new movement patterns. Fine motor tasks such as drawing with crayons were met

with frustration due to tactile defensiveness with the crayon texture.

Interventions: Provided vestibular and proprioceptive input to promote self-regulation. Utilized heavy work activities to provide calming sensory input. Introduced tactile exploratory play with various textures (e.g., dried beans, playdough) with therapist modeling and gradual participation.

Assessment (A):

Emily continues to exhibit challenges with sensory modulation, particularly with

vestibular and tactile input. Her initial resistance and avoidance behaviors demonstrate significant gravitational insecurity and a need for careful introduction to new movement experiences. The "wiggly tummy" description reflects a discomfort with vestibular stimulation. However, her willingness to engage in deep pressure activities and her tolerance for linear vestibular input when combined with deep pressure suggests a strategy for building sensory tolerance. Her ability to engage in crawling through tunnels indicates a good foundation for body awareness

and motor planning when combined with predictable and non-threatening sensory input. The ongoing tactile defensiveness with fine motor tasks is a barrier to developing fine motor skills and should be addressed systematically. Continued OT is necessary to provide a structured sensory environment that supports regulation, builds tolerance to sensory input, and improves participation in age-appropriate activities.

Plan (P):

Continue OT 2x/week for 6 weeks.

1. Gradually increase duration and

intensity of linear vestibular activities, ensuring deep pressure input is available as a regulating tool.

- 2. Introduce rotary vestibular input with caution and close monitoring for signs of dysregulation.**
- 3. Continue heavy work and deep pressure activities to promote a sense of calm and body awareness.**
- 4. Systematically address tactile defensiveness by gradually introducing a wider range of textures during play-based activities, starting with less aversive textures and**

progressing as tolerated.

- 5. Encourage participation in gross motor activities that challenge gravitational insecurity in a supportive environment (e.g., low climbing structures with spotter).**
- 6. Educate parents on incorporating sensory diet strategies at home to support regulation between sessions.**

Example 3: Geriatric Patient - Home Safety and Fall Prevention

Client Name: Margaret Davis

Date of Service: 2023-10-27

**Diagnosis: Age-related decline,
Mild Cognitive Impairment,
History of Falls**

OT Session #: 3

Subjective (S):

"I'm feeling a little unsteady on my feet today. The doctor said I almost fell last week when I went to get the mail. I'm worried about falling in the bathroom because the floor feels slippery sometimes. I wish I could reach the top shelf in my kitchen to get my good teapot."

Objective (O):

Observation: Patient ambulates with a cane, exhibiting a slightly wide base of support and occasional hesitation. Appears

anxious when discussing balance.

Functional Mobility: Timed Up and Go (TUG) test: 18 seconds (increased from 16 seconds last session). Demonstrates reduced confidence when turning.

Home Assessment (Virtual/In-person): Identified several fall hazards: throw rugs in hallways, poor lighting in the bathroom, cluttered kitchen counter, inability to safely reach items on high shelves.

Interventions: Provided education on safe ambulation techniques with a cane, including how to navigate turns and uneven surfaces. Demonstrated and

practiced safe transfers (bed, chair). Discussed and recommended non-slip mats for the bathroom and removal of throw rugs. Provided recommendations for grab bars in the shower. Demonstrated the use of a reacher tool for accessing items on high shelves.

Assessment (A):

Ms. Davis continues to present with age-related declines impacting her balance and confidence, evidenced by her subjective report of unsteadiness and the increase in her TUG score. Her anxiety surrounding

falls, particularly in the bathroom, highlights the need for environmental modifications and compensatory strategies. The identified fall hazards in her home are significant risk factors for future falls. Her desire to access the top shelf indicates a need for adaptive equipment to promote independence and safety in the kitchen. Continued occupational therapy is essential to implement safety modifications, train in the use of adaptive equipment, and improve her functional mobility and balance to reduce the risk of falls and maintain her independence

at home.

Plan (P):

Continue OT 1x/week for 3 weeks.

- 1. Follow up on implementation of recommended home modifications (non-slip mats, removal of throw rugs, grab bar installation).**
- 2. Provide further training on the safe use of the reacher tool for retrieving items from high shelves and other difficult-to-access areas.**
- 3. Incorporate seated and standing exercises to improve core strength and lower extremity strength for better balance.**

- 4. Address cognitive strategies for fall prevention, such as visual scanning and task sequencing.**
- 5. Educate patient and family on recognizing and responding to situations that increase fall risk.**
- 6. Continue to monitor TUG score and functional mobility.**

Key Takeaways for Effective Soap Note Documentation in OT

These examples illustrate the core principles of SOAP note documentation in occupational therapy. Here are some key takeaways for practitioners:

- 1. Be Specific and Measurable:
Avoid vague language. Use**

objective data whenever possible. Quantify limitations and progress.

- 2. Focus on Function: Connect interventions and observations to the patient's functional goals and ability to perform Activities of Daily Living (ADLs) and Instrumental Activities of Daily Living (IADLs).**
- 3. Justify Services: The Assessment section is crucial for demonstrating the medical necessity of OT services and the patient's progress towards goals.**
- 4. Client-Centered Approach: Incorporate the patient's**

subjective reports and goals to demonstrate a truly client-centered practice.

- 5. Clear and Concise Language: Use professional terminology but ensure clarity for all readers. Avoid jargon that might not be understood by other healthcare professionals.**
- 6. Consistency is Key: Maintain a consistent format and level of detail across all your documentation.**

Mastering the art of writing effective SOAP notes is an ongoing process. By understanding the purpose of each section and applying these

principles to various clinical scenarios, occupational therapists can ensure their documentation is accurate, comprehensive, and a valuable asset in delivering and advocating for high-quality patient care. The examples provided here serve as a foundation, but always remember to tailor your documentation to the individual needs and progress of each unique client.

Questions & Answers About examples of soap notes for occupational therapy

No	Question	Answer
----	----------	--------

1	What's the most common SOAP note format used in pediatric occupational therapy?	The standard SOAP format (Subjective, Objective, Assessment, Plan) is widely used in pediatric OT. It helps track a child's progress and communicate effectively with parents and other professionals.
2	Can you give a quick example of the 'Subjective' section for an adult OT patient?	Certainly. 'Subjective': Patient reports increased pain (5/10) in their right shoulder after yesterday's exercises, limiting overhead reaching. They also express frustration with difficulty buttoning their shirt independently.
3	What kind of information belongs in the 'Objective' section of an OT SOAP note?	The 'Objective' section details observable and measurable findings. This includes therapy interventions performed, client's performance on assessments or tasks, range of motion measurements, strength grades, and any observed behaviors or responses.
4	How do OTs typically document 'Assessment' for a patient recovering from a stroke?	In the 'Assessment' section, an OT might write: 'Patient demonstrates improved fine motor control in the affected hand (R hand) with ability to pick up smaller objects. However, challenges with grasp strength and sustained manipulation persist, impacting ADLs like dressing.'

5	What's crucial to include in the 'Plan' section of an OT SOAP note?	The 'Plan' outlines future interventions. It should specify the frequency and duration of future therapy sessions, proposed goals, interventions to be addressed in the next session, and any referrals or recommendations made.
6	Are there specific SOAP note examples for geriatric occupational therapy focusing on home safety?	Yes. For home safety, an OT might note in 'Objective' that the patient requires an assistive device for ambulation and has a fall risk due to poor balance. In 'Assessment,' they'd link this to potential unsafe practices at home. The 'Plan' would detail recommendations for grab bars, walker use, and caregiver education.
7	What makes a SOAP note example particularly good for demonstrating progress?	A good SOAP note example shows a clear progression from previous sessions. For instance, the 'Subjective' might report less pain, the 'Objective' might show improved performance metrics, and the 'Assessment' would reflect how these changes contribute to achieving goals.

8	Where can I find more detailed examples of SOAP notes for different OT specialties?	Many professional occupational therapy organizations, university websites, and online therapy resource platforms offer a wealth of detailed SOAP note examples categorized by specialty (e.g., pediatrics, physical disabilities, mental health).
